Absolutely. In fact, for a prototype or portfolio project, **I would recommend synthetic data rather than connecting to SAP initially.**

Many AI PMs and AI engineers make the mistake of spending months trying to integrate with SAP before proving the concept.

For your use case, the value is not:

“Can I connect to AIF?”

The value is:

“Can an agent correctly diagnose and route a failed CFIN document?”

You can demonstrate that with synthetic data.

What Synthetic Data You Need

Create 4 datasets.

1. Failed Documents

```
{
  "document_id": "CFIN10001",
  "source_system": "ECC_US",
  "company_code": "US01",
  "vendor": "V1000",
  "cost_center": "CC1001",
  "gl_account": "400100",
  "amount": 5000,
  "status": "FAILED"
}
```

Generate **500–1000** examples.

2. Error Log Dataset

```
{
  "document_id": "CFIN10001",
  "error_code": "CFIN_001",
  "error_text": "Cost Center CC1001 does not exist"
}
```

Examples:

- Cost center missing
 - GL mapping missing
 - Vendor missing
 - Tax code invalid
 - Posting period closed
 - Currency mismatch
 - Authorization error
 - Replication failure
-

3. Master Data Dataset

```
{
  "cost_center": "CC1001",
  "exists": false
}

{
  "vendor": "V1000",
  "exists": true
}
```

4. Historical Resolution Dataset

This is the most important one.

```
{
  "error_code": "CFIN_001",
  "root_cause": "Missing Cost Center Mapping",
  "resolution": "Create Cost Center Mapping",
  "resolver_team": "Master Data Team",
  "success_rate": 98
}
```

This becomes your RAG knowledge base.

Agent Architecture for a Prototype

You don't need multiple agents initially.

```
Failed Document
  ↓
Context Retrieval
  ↓
LLM
  ↓
Diagnosis
  ↓
Routing Recommendation
```

For example:

Input:

Error:
Cost Center CC1001 does not exist

Retrieved context:

Historical Cases:
14 similar occurrences

Resolution:
Create mapping

Owner:
Master Data Team

Output:

```
{
  "root_cause": "Missing Cost Center Mapping",
  "owner": "Master Data Team",
  "confidence": 0.96
}
```

That's already a compelling demo.

How to Make It Feel Real

Since you have 10 years of SAP transformation experience, you know the common failure patterns.

Create realistic scenarios:

Error Type	Frequency
Missing BP	High
Missing Cost Center	High
Missing GL Mapping	High
Tax Configuration	Medium
Closed Period	Medium
Technical Replication Failure	Low
Authorization Failure	Low

This will look much more authentic than random synthetic data.

What Would Impress Recruiters or Clients

Don't focus on SAP integration.

Focus on:

Evaluation Dataset

Create 100 labelled cases:

```
{  
  "error": "Cost Center missing",  
  "expected_owner": "MDM Team",  
  "expected_resolution": "Create Mapping"  
}
```

Then measure:

- Diagnosis Accuracy
- Routing Accuracy
- Confidence Scores
- Hallucination Rate

This ties directly into the AI Evals work you've been learning recently.

If I were building this as an AI PM portfolio project

Given your background in SAP Finance, Data & AI, and your recent focus on evals, I'd build:

Demo 1

CFIN Failure Triage Agent

Input:

- Failed document
- Error log

Output:

- Root cause
- Resolver team
- Recommended action

Demo 2**CFIN Resolution Agent**

Input:

- Failed document

Output:

- Execute simulated fix
- Reprocess document
- Generate audit trail

Using entirely synthetic SAP data.

That gets you 90% of the storytelling value without needing access to a real SAP landscape, and it showcases agent design, RAG, evals, observability, and enterprise workflow automation—all highly relevant for AI PM roles.
